

ERRATUM:

Evaluation of the relationship between pediatric patients with mosaic down syndrome and hypothyroidism and treatment with honey: a cross-sectional study

Following publication of the article by Al-Samarraie in the International Journal of Nutrology, volume 19, supplement 3, 2026, DOI 10.54448/ijn26S317, the journal identified incomplete wording in the reporting of informed consent and child assent. The original article referred to verbal agreement by participants and did not clearly state the consent of parents or legal guardians and the assent of the participating children. The author and the Editor confirmed that the study was approved by University of Baghdad Institutional Review Board, Baghdad, Iraq (reference No. 0854; 22 March 2025), that written informed consent was obtained from the parents or legal guardians, and that age-appropriate assent was obtained from the children before sample collection and study procedures. The Abstract, the Materials and Methods section, and the final Ethical Approval and Informed Consent declarations have been corrected accordingly. The static "Check for updates" image, which was not connected to an operational Crossmark record, was also removed from the revised PDF. These corrections clarify the ethical documentation and do not alter the dataset or numerical results reported in the article. The original version, published on August 1, 2026, and the corrected version, published on September 23, 2026, remain publicly available on the article page
